

PART VIII. INDIVIDUAL TECHNICAL DEFENSE — PREPARATION NOTES

10 points

Part VIII has no section in the submitted document. It is assessed orally: each member is questioned separately, and scores may differ between members of the same group. These notes are preparation material only — do not submit them.

Questions every member should be able to answer

Likely question	Answer grounded in SALINLAHI
What does this component do?	Take Scene Objective Controller as the worked example: it drives the ordered list of spoken-word objectives for one scene — showing each prompt, setting the target word, and advancing when the word is said correctly.
What requirement does it support?	Specific objective 2 of Chapter 1: implement voice commands that let players perform specific actions in the game.
What information does it receive?	Its objective list, configured per scene (word, accepted variants, prompt, instruction audio, effect), and OnAnswerChecked events from Voice Command.
What does it return?	The prompt display, the per-word effect raised on a correct answer, and a scene-complete event when the last objective is done.
Why is this data persistent?	Two different reasons. Session results persist remotely because the evaluation phase needs results pooled across testers and devices. Nickname and unlock progress persist locally because they must work at startup and without a connection.
Why did your group choose this database?	Supabase gives PostgreSQL with a REST interface, so the game reaches it with UnityWebRequest and no third-party SDK, and the group writes and hosts no server of its own. The data is relational — one row per finished session — and Row Level Security controls access without a backend.
How does the component talk to the database?	Supabase Client issues HTTPS requests with JSON bodies: a POST to insert one row, a GET with order and limit to read recent rows. The anon public key goes in the request headers.
What happens when saving fails?	The error is logged and the record is lost, not queued. The completion panel still shows the run's score because that comes from Run Score, and the level still unlocks because unlocking is local. An offline queue is listed as planned work.
Where is this component in the repository?	Everything in Figure 1 maps to a file in Part V. Voice work is in Assets/Scripts/VoiceCommand.cs and PronunciationChecker.cs; database work is in SupabaseClient.cs.
Why are scoring and counting separate components?	A level spans several scenes. Run Score Counter counts within a scene; Run Score is static so the total survives scene loads. Counting in one place gave a total that silently dropped the earlier scenes' words.

Three things everyone must know, whatever they built

- **The shape of the architecture.** One Unity client, three internal layers, two external services, no custom backend.
- **Where data lives and why.** Session results in Supabase; nickname and progress in PlayerPrefs.
- **One integration flow end to end.** Saving a session result is the easiest to narrate: last word spoken, totals read, record built, POST, row inserted, panel shown.

Personal contribution and next assigned work

Each member is asked what they personally implemented and what they work on next. The rows below follow the roles in the repository README and the Assigned column of Part VI. **Confirm these against what each of you actually did** — claim only your own work.

Member	Was responsible for	Next assigned work	Must exist first
Daquis, Jhesza Mhei G. <i>Game Logic Developer</i>	Voice command flow, pronunciation matching, objective sequencing, score aggregation across scenes, the Bahay and Paaralan scenes	Build Paaralan Scenes 2 and 3; add the offline save queue	Milestone 1, so new scenes are authored with audio from the start
Lacida, Kylo Bryan <i>UI and Testing Lead</i>	Main menu, nickname dialog, level-select map and badges, per-scene prompt UI, device testing	Record and import the voice-over clips; format the recent results as a readable leaderboard	The recording script, which is already complete in Docs/VoiceOverScript.csv
Manzanero, Kyla Samantha <i>Documentation Lead</i>	Database schema and Row Level Security policies, setup documentation, this technical design	Introduce the players table and per-player filtering; add a check constraint for non-negative values; prepare the evaluation instrument	Group agreement on the schema change before it is applied

If you are asked something you do not know, say which member owns that part and what you do know about how it connects to yours. The examiner is testing whether you understand the system, not whether you wrote every line of it.
